[a] This station was reduced to third class from September 1, 1911 to May 31, 1912.

[b] Owing to some unavoidable defects in the recording instrument, the velocity of the wind had to be omitted occasionally for a few days in several months and in several of the stations included in these summaries.

[c] 25 days of observation.

[d] Approximate estimate made by the observer as the rain gauge was blown down by a NW gale at about 7 p. m. of the 15th.

[e] 21 days of observation.

[f] No observation was made of wind direction on November 12, 2 a. m., 6 p. m. and 10 p. m.; and on the days 13th to 16th.

[g] 29 days of observation.

[h] No observation was made of wind direction on June 3, 2 a. m.

[i] The rainfall from 1 to 6 a. m. of the 25th could not be included in this total.

INTRODUCTION.

The Antipolo Magnetic Observatory, which is a division or branch of the Weather Bureau, Manila Observatory, was located at Manila in the Observatory grounds until 1904. It was temporarily closed on account of the electric car system established in that city. The new location of the observatory lies due east of the old at a distance of 18.5 kilometers. The coördinates of the variation building are 121° 10′ E and 14° 36′ N, its elevation above the sea level about 215 meters.

A description of the buildings, instruments, and method both of observation and of reduction, will be found in the "Annual Report of the Weather Bureau for the year 1911, Part IV." The arrangement of the magnetic values in this publication is the same as that of 1911; we adopted the distribution given by the Coast and Geodetic Survey of the United States of America to similar publications of its magnetic observatories.

For all the observations the Insular standard time of the Philippine Archipelago, eight hours (8^h) or the 120^{th} meridian east of Greenwich, is used.

Diurnal variation of D.

1912.
